

Category Manager

Categories are groups of concepts that are used in several Patient Screening applications, such as Inteliquery™ and Clinical Trial Editor.

You can create and manage site-specific categories so end users can select whole categories instead of searching for sets of concepts individually. Regional categories are configured outside of Category Manager by Inteliquet™ in collaboration with facilities in each region.

Categories are structured in a hierarchy with roots at the top level, categories in the middle, and concepts at the bottom.

[Click here to view an example of how roots, categories, and concepts are displayed in Patient Screening.](#)

Roots

Roots represent a classification of categories so Patient Screening knows where to display them in applications like Inteliquery™ and Clinical Trial Editor. In order to pull appropriate concepts to populate categories, each root has an assigned **Concept Type** from Concept Manager. All concepts from a root's **Concept Type** are available for categories under that root.

Roots are predefined, so they cannot be edited.

Categories

Categories are groups of concepts. Each category can be configured for multiple languages, if needed.

Categories are editable and configured by administrators.

Note: While other roots enable you to create a new category with any name using a text box, **Primary Cancer Site** requires that you select an unused category from a menu. The options that populate that menu are the concepts configured under the **Cancer Site** concept type in Concept Manager. If you want to create a new category under the **Primary Cancer Site** root, but the menu doesn't contain an appropriate option, you must first create a concept for that category in Concept Manager.

Concepts

Concepts are the same options configured in Concept Manager. Please see **Related Topics** for more information on concepts.

Concepts cannot be edited in Category Manager.
